Hi Lacey – In looking at this and the other e-mail, I think we will need to extract what we need and shoot it to the 6a2 staff to facilitate their search for reports on these incidents.

I think can use excel to capture the data. Column headings could include incident date, incident description, product name and/or registration number and registrant contacted (yes/no). It probably wouldn't hurt to have the case number Iowa uses as that would allow the 6a2 staff to contact IDALS directly and quickly identify any case they had questions about.

Is this all information you can gather without having to ask IDALS to do additional work?

Subject: IDALS Detasseling Incident

Jamie,

I spoke with Gretchen with IDALS yesterday regarding the alleged WPS-migrant workers aerial application spray drift. She stated that the detasseling crew were in a corn field and the application was made on a soybean field. The application had taken place on July 28. IDALS investigators were able to get out to the field on the same day as the application. The crew consisted of 15 migrant workers that were allegedly sprayed with a fungicide (Priaxor) and an insecticide (Lambda Select). The migrant workers went through a decontamination and statements were collected, along with samples.

I have attached IDALS FY17 human exposure incidences that occurred during last fiscal year regarding human exposure cases and aerial applications.
